Smartly — SOAP Partner Integration

Purpose: send booking decision notices to a fictional campus notification partner. SOAP is used for an explicit WSDL-described contract, XML headers/body and standard SOAP Fault handling.

WSDL: ../../partner.wsdl. Sample envelope files: ../../soap-request.xml, ../../soap-response.xml, ../../soap-fault.xml.

HTTP binding: POST https://partner.example.edu/soap/NotificationService; Content-Type: text/xml; charset=utf-8; SOAPAction: urn:smartly:notification:SendDecisionNotice.

Discovery: direct WSDL URL or a single catalogue record. The endpoint is fictional and reserved for examples; no live partner/UDDI registry has been contacted.

Fault mapping: partner RecipientUnavailable maps to Smartly notification-delivery-failed. Partner-specific vocabulary and raw fault XML must not leak through the public REST contract.

Security note: credentials in the XML are demonstrative placeholders only; use a secret manager and TLS in a real deployment.
